

Digital Knowledge & Learning Portal

Stack: VS Code • HTML/CSS • Figma (UI/UX) • Structured content model (taxonomy + metadata)

Problem

- Fragmented knowledge spread across shared drives, email threads, and ad-hoc docs created **information silos**.
- Teams lacked a reliable **Single Source of Truth (SSOT)** for policies, onboarding content, and learning paths.
- As a result, the same questions were repeatedly routed to enablement/admin teams (high help-desk volume, slow time-to-answer).

Technical Implementation

1) Data structure (content model)

- Defined a normalized information architecture:
 - **Categories** (e.g., Onboarding, Tools, Policies, Playbooks)
 - **Content types** (Guide, FAQ, SOP, Template, Video, Course)
 - **Audience / role tags** (e.g., IC, Manager, New Hire)
 - **Ownership + review cadence** (owner, last reviewed, next review)
- Implemented metadata-driven organization so content could be:
 - filtered by audience and topic
 - searched consistently (predictable naming + tags)
 - maintained over time (ownership + freshness controls)

2) UI/UX design in Figma

- Designed a portal experience optimized for speed-to-answer:
 - **Global navigation** (by category + audience)
 - **Search-first landing** with quick filters (type, role, topic)
 - **Reusable components** (cards, category tiles, "related content" blocks, breadcrumbs)
- Produced a lightweight design system:
 - spacing + typography scale
 - component states (hover/active/disabled)
 - accessibility considerations (contrast, hierarchy, focus cues)

3) Coding the portal (VS Code + CSS)

- Built the front-end implementation using **VS Code** as the primary dev environment:
 - componentized page layouts (home, category, article, learning path)
 - responsive styling with **CSS** (mobile-first breakpoints)
 - consistent theming via CSS variables (colors, spacing, radii)
- CSS approach (pragmatic + maintainable):
 - predictable class naming and layout primitives (grid/flex utilities where helpful)
 - reusable patterns for cards, tables, callouts, and code snippets
 - performance-minded styling (avoid heavy overrides; keep specificity low)

PM Perspective

Content migration (controlled + measurable)

- Ran the migration as a phased delivery:
 1. **Inventory** existing content (source, owner, relevance, duplicates)
 2. **Triage** (keep / merge / rewrite / archive)

3. **Map** content to the new taxonomy + metadata schema
 4. **Migrate + validate** (links, attachments, permissions, formatting)
- Set clear acceptance criteria:
 - every asset has an owner, category, and review cadence
 - no orphaned pages; consistent naming conventions
 - search results return expected top hits for common queries

Scalability & governance

- Designed for sustainable growth:
 - lightweight governance (owner + review reminders, standards, and templates)
 - modular IA (easy to add new categories/content types without rework)
 - clear “publish” workflow to avoid reintroducing silos

Outcome

- Delivered a centralized **Digital Knowledge & Learning Portal** that functions as the SSOT for learning and operational content.
- Improved discoverability and reduced time spent searching for answers.
- **Reduced help-desk inquiries** by making “self-serve answers” the default path, supported by:
 - better information architecture
 - faster navigation/search
 - standardized page templates and ownership

Project Management Tables

Task Breakdown (Execution)

Due	Status	Priority	Owner	Task
	Not started	High		Define taxonomy +

Due	Status	Priority	Owner	Task
				metadata schema
	Not started	High		Figma IA + components (navigation, cards, filters)
	Not started	High		Implement portal UI (VS Code + CSS)
	Not started	High		Content inventory + dedup
	Not started	High		Migrate content + QA (links, permissions, formatting)

Milestones (Plan)

Status	Owner	Success criteria	Target date	Milestone
Not started		Taxonomy + templates finalized; naming conventions agreed		M1 — Information architecture approved
Not started		Key user flows validated; components ready for build		M2 — Design sign-off (Figma)
Not started		Search + navigation live; core categories published		M3 — MVP portal shipped
Not started		content 90%=< mapped to schema; duplicates		M4 — Migration complete

Status	Owner	Success criteria	Target date	Milestone
		archived; broken links = 0		
Not started		Help-desk inquiries reduced; search success measured; owners assigned		M5 — Adoption + KPI baseline

Risks / Issues Log

Owner	Mitigation / Action	Likelihood	Impact	Risk / Issue
	Assign owner + review cadence; enforce publish checklist	Medium	High	Unclear content ownership leads to stale pages
	Define MVP; backlog the rest; ship in phases	Medium	Medium	Scope creep (more categories/features than MVP)
	QA checklist; sample audits; permission matrix	Low	High	Migration introduces broken links / permissions gaps
